

# Washing Machine Timers (Used)

**Timers have no warranty**, the only way to test them is to install them in a machine and test the machine. The timer motor may be tested to see if it rotates the timer.

I will select only one that should work. If they do not work when installed then check the wiring for correct connections. It is easy to make a mistake with the Etn timers with individual wires and connectors. The ones with plugs are easier.

**Please confirm that you have read the no warranty statement.**

If you think the timer is faulty, describe the fault to me, I may be able to suggest what is wrong. If you cannot fix the problem then post timer back to me and I will refund the purchase price (but not the postage)

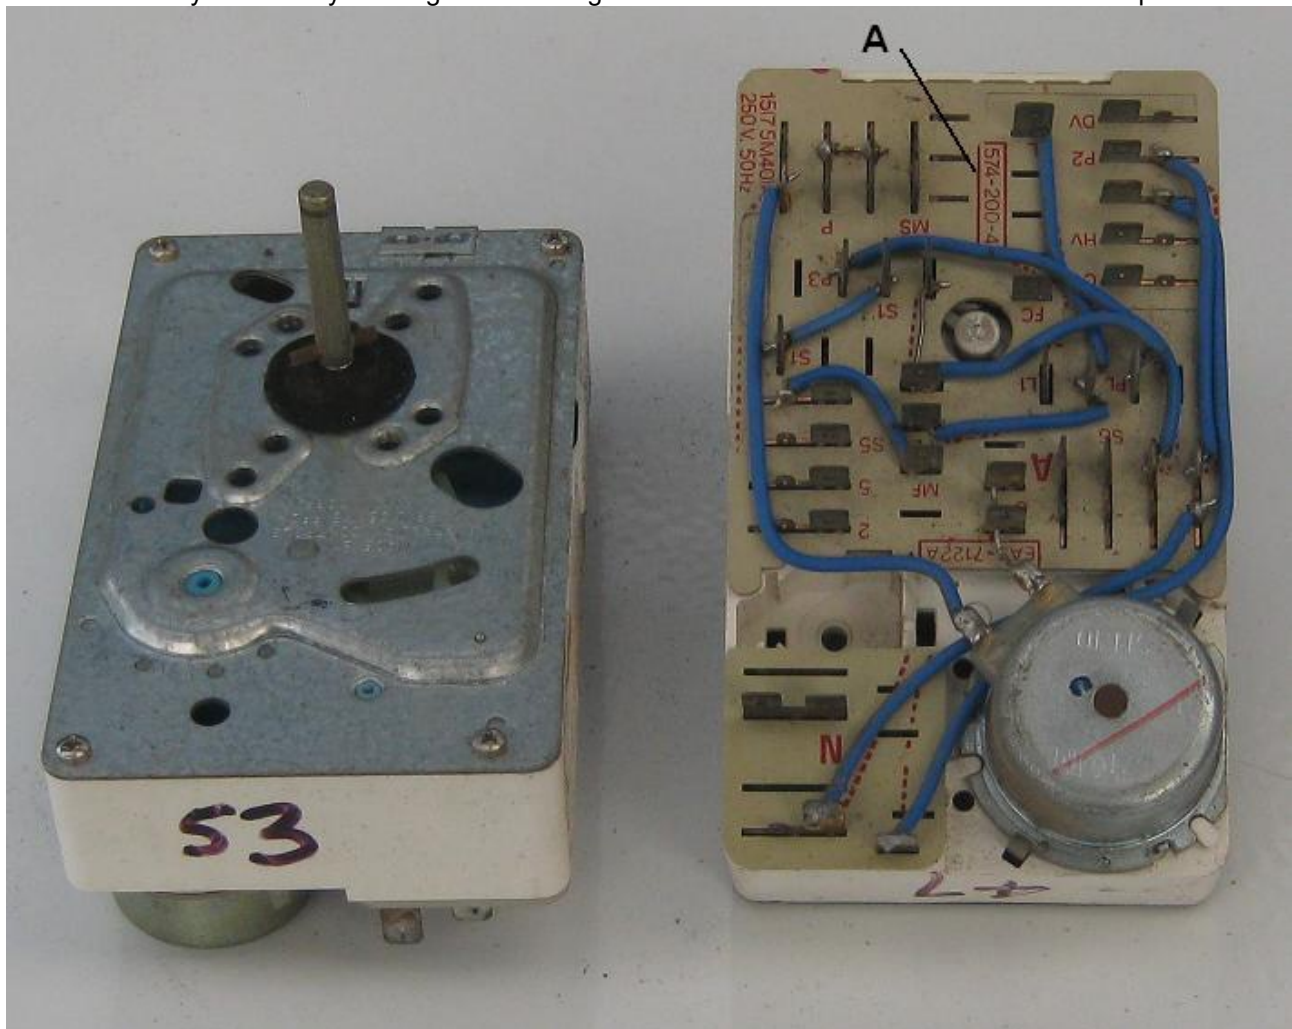

## Alternative to used timers.

1. A new timer
2. Recondition timer (search the net, most people do not do it anymore.)

I do not have model information, you need to get the timer number ("A" in the picture of the Etn timer, This one is 574 200 47)

## Etn timers with plastic shafts:

These have been made with economy measure to them which effect reliability and long life, mainly to the cam mechanism. If the timer starts doing strange things like switch thing on and not switching them on then the timer is likely to be faulty. I changed from using reconditioned timers to new ones due to this problem.

**PCB for washer and dryers** These are supplied without a warranty. The only way to test them is to install the in a machine. I can be difficult as variation in software with similar/same model will cause the PCB not to work. Ask
